1 # ABSTRACT OF THE DISCLOSURE

2 ## Internet Site Authentication Service

3 The authenticity of a website is tested with software that runs on a personal computing
4 device and a service that is provided via the Internet. The software on the personal
5 computing device is in the form of a proxy, or transparent component in the Internet
6 Protocol implementation. The proxy receives all outbound messages, analyzes them and
7 forwards or modifies them without the user's intervention. The service tests the IP address
8 and/or the behavior of the target website.
